Fusion ERP Lab — Assignment 6

Submission Instructions

This document covers only how to submit your pilot work — raising your pull request and filling in the submission form.

1. Git basics: switching branches without losing work

If you are in the middle of changes on one branch and need to switch to another — for example, to create a clean submission branch off main without carrying your in-progress edits — use stash to set your current changes aside, switch branches, then bring them back when you return:

```
# 1. Hide your current changes
git stash

# 2. Checkout another branch
git switch new-branch-name

# 4. Restore your hidden changes
git stash pop
```

git stash temporarily shelves uncommitted changes so your working tree is clean; git stash pop brings them back. Nothing is lost in between — it sits on a stack until you restore it.

2. Raising your pull request

Once your ELM implementation is ready to submit:

1. Fork FusionIIIT/Fusion-Integrated on GitHub, if you have not already.

   Or if already forked, then sync local codebase with latest commit.
2. Create your own branch off main for your submission. Do not commit directly to main, and do not share a branch with another pair.
3. Push your branch to your fork.
4. Open a pull request from your branch to main on FusionIIIT/Fusion-Integrated — not to your fork's own main.
5. Copy the URL of the pull request you just opened. You will paste it into the submission form in the next step.

3. Submission form

Link:
https://docs.google.com/forms/d/e/1FAIpQLSciJJytwPMUybeltCMsLa6Ee0DNTZ_Gwy6zsN67MTw-3Xndvw/viewform?usp=publish-editor

After your PR is open, fill in the Google Form shared with you separately. It asks for:

Field	**What to enter**
Roll number	Your own roll number.
Partner's roll number	Your pair partner's roll number.
Pull request link	The full URL of the PR you raised in Step 2 (e.g. https://github.com/FusionIIIT/Fusion-Integrated/pull/NN).
Model used	Which open-source / local AI model generated the code in this PR, with its parameters: exact model name and version, parameter size, quantization (if any), and the inference runtime / coding agent you used.
